

Eimac Announces a Second Exceptional Tube

The Only 50-Watter
That Allows High-Voltage Operation

UNSURPASSED IN RUGGEDNESS AND PERFORMANCE

THE new EIMAC 50-T Low-C Triode is the only small-size transmitting tube which has no 1250 volt plate voltage limitation. In no sense of the word is it an overgrown receiving tube. It has a truly high vacuum, Tantalum Grid and Plate and a hard Nonex Glass Envelope. There are no internal insulators to give off gas or break down, and the expedient of a "Getter" has not been resorted to in exhausting the tube. Its exceptionally high mutual conductance indicates that it is very easy to drive, even with only 1000 volts on the plate. Approximately 10 watts of grid driving power, such as secured from a '45 buffer stage, will usually be sufficient to obtain normal output and efficiency as a class C amplifier.

A pair of EIMAC 50-Ts in Class B Audio will give 150 watts of audio power output at 1000 volts, 200 watts at 2000 volts and 250 watts output with 3000 volts on the plates.

EIMAC 50-T

\$12.00 Net to Amateurs
