

FORWARD AGAIN!

THE name *United* simply relabels a perpetuated institution — an indomitable engineering group which insists on continuing its independent trail-blazing. *United Transmitting Tubes* represent, under a new banner, the continuity of a projected program of betterment in which our engineers have played a leading role for many years.

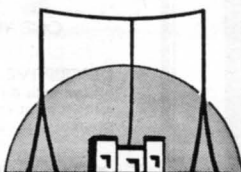

Up-to-the-minute laboratory equipment and manufacturing facilities are in use at the new *United Electronics* plant and *United Tubes* embody new elements of refinement.

United
TRANSMITTING TUBES

The *Graphite Anode* used in every *United* tube was first put into successful practice by the men who are now in our organization. The *Floating Anode* is another feature which distinguishes *United Tubes*. These are only two structural refinements over many invisible but correspondingly valuable improvements which enhance the characteristics of these tubes. Our interest is engaged solely in high quality tube requirements.

United Tubes are already in the hands of leading distributors in various parts of the country. Consult them for further details or write to us direct.
